None of the site's content can be found! This is where you would add a helpful introduction to the blog post. In this introduction, start by sharing what it is about. You should then follow with a sentence or two telling readers what they will learn when they read the article and why it might be interesting to them. Bear in mind that these sentences will not appear in the published post but might show up in Google search results for your page. The rest of your blog post will appear here once you publish it. Web design has evolved recently due to the fast change of technology, the use of Internet in people's lives, and the increase in devices used to browse websites. These things have influenced web design towards a more user friendly, effective, and enjoyable way. Web design plays an important role in communication between two or more parties in an organization or business. The main purpose of web design is to improve communication by providing information easier access. There are various elements that constitute a web page, such as: text, images, navigation menus, and many more. When all these elements are combined in a specific way they can create web pages that serve different functions. One of the most important factors in web design is readability. Readability is the ability to understand the written content easily and quickly. This is mostly influenced by two criteria: typography and color scheme or contrast between text and background color. The use of typography depends on the function of a page. Most websites utilize a font family with a high level of readability because it provides a friendly experience for users to understand content easily from the site layout, color scheme, structure or other design aspects. The color scheme of a website affects not only the written content on the page, but also other elements on the page, such as images and videos. A good color scheme is one that has high contrast between text and background color. Another important factor to consider when designing a website is its usability. Usability refers to how easy it is for people to use the site's content. Websites are designed in different ways so it all depends on what you want to achieve with your design. However, most websites follow certain accepted rules of usability including: color, navigation, load time, search engine optimization (SEO), scalability of design, etc. The goal of the web design is to make it interactive and easy for users to access information. Although, people can still interact with websites in different ways: reading, watching, and searching. A website that has a better user experience is one that has a better user experience that's why usability plays an important role in web design. Designers should begin their design by considering what the users want and need from the website. A good web designer should know how to adapt their website to meet these needs while also making it fun for the users so they keep returning to the site rather than browsing other sites.
